MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Mon Mar 8 14:55:25 1999; MasPar time 37.44 Seconds 733.893 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score: Sequence: >US-08-866-354-43 (1-498) from US08866354.pep 2337

1 MVXXLXXXPXPPXXXXXXLXL.....XLPVLMLTALAXLLSXXXXXS 498

Scoring table: PAM 150 Gap 11

Searched: 180763 seqs, 55169189 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: sptremb18

1:sp_archea 2:sp_bacteria 3:sp_fungi 4:sp_human 5:sp_invertebrate 6:sp_mammal 7:sp_mhc 8:sp_organelle 9:sp_phage 10:sp_plant 11:sp_rodent 12:sp_unclassified 13:sp_vertebrate 14:sp_virus

Statistics: Mean 43.734; Variance 73.928; scale 0.592

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                             creceptor protein, triggering Ret dimerisation and/or autophosphorylation of the Ret tyrosine kinase domain. The amino acid sequence was deduced from a cDNA clone (see V00245) obtained from a rat embryonic kidney cDNA expression library. Human RetL1 as well as mouse and human RetL2 and RetL3 sequences have also been identified (see W37458-63). Vectors containing retL1 DNA and prokaryotic or eukaryotic host cells transformed or transfected with these vectors are claimed, as well as a method for production of RetL1, its soluble variants (e.g. mano acids 1-434) and fusion proteins with a toxin, imageable compound or radionuclide. RetL1, optionally when expressed from vectors in vivo, is used to promote growth of new tissue and survival of damaged tissue, particularly kidney or neural tissue. Typical applications are in renal failure, nebritts, kidney transplants, toxic or hypoxic injury, neurodegeneration, motor neurone disease, multiple sclerosis, bacterial, viral or prion infections (e.g. meningitis, myelopathy cassociated with HIV or Creutzfeldt-Jakob disease), cranial nerve or spinal cord injury, developmental disorders such as Down's syndrome and cerebral palsy, or conditions involving the peripheral nervous system (Lyme disease, muscular dystrophy and myasthenia gravis). Fusion proteins are used to deliver toxins etc. to Ret-expressing collar, especially tumours.
                                                                                                                                                                                                                                                                                                                                                   Query Match

CC deduced from a cDNA clone (see V00248) isolated from a human foetal
CC deduced from a cDNA clone (see V00248) isolated from a human foetal
CC liver library. Rat and human RetLi, and human and mouse RetLi.3
CC RetL2 is 49.1% identical to human RetLi, and human RetLi is a
key component of the Ret signalling pathway that specifically
CC interacts with Ret receptor protein, triggering Ret dimerisation
CC component of the Ret signalling pathway that specifically
CC interacts with Ret receptor protein, triggering Ret dimerisation
CC and/or autophosphorylation of the Ret tyrosine kinase domain.
CC vectors containing retL2 DNA and prokaryotic or eukaryotic host
CC cells transformed or transfected with these vectors are claimed, as
CC well as a method for production of RetL2, its soluble variants and
CC stated and the acxin, imageable compound or radionuclide.
CC RetL2, optionally when expressed from vectors in vivo, is used to
CC particularly kidney or neural tissue. Typical applications are in
CC considered with HIV or Creutzfeldt-Jakob disease, multiple sclerosis,
CC associated with HIV or Creutzfeldt-Jakob disease, multiple sclerosis,
CC seculated with HIV or Creutzfeldt-Jakob disease), cranial nerve or
CC spinal cord injury, developmental disorders such as Down's syndrome
CC system (Lyme disease, muscular dystrophy and myasthenia gravis).

Claim 1: Pages 91-93; 196pp; English.

The present sequence is the human glial cell line-derived neurotrophic factor (GDNF) receptor, which can be used to treat dopaminergic nerve cell disorders, e.g. Parkinson's and Alzheimer's disease or amyotrophic lateral sclerosis, complications of diabetes and Huntington's disease and (optionally in combination with GDNF) glaucoma, retinal degeneration and hearing loss caused by injury to inner ear sensory neurons. The receptor can also be used to block stabilise GDNF activity, analyse GDNF related molecules and set in pharmaceutical formulations. Receptor expressing cells, preferably transfected ex vivo, can be used similarly by implantation, and the use of the receptor CDNA in gene therapy is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         also contemplated. Probes based on the cDNA can be used to identify GDNF responsive cells and tissues, e.g. to identify patients who would benefit from GDNF therapy, and abnormalities in receptor expression, and to isolate molecules that form a complex with the cDNA or are homologous/cross-reactive with the cDNA. Anti-receptor antibodies, oligonucleotides derived from the cDNA and animal models that overexpress the receptor can be used to study the biological function of GDNF, knockout transgenic animals can be used to detect GDNF dependent neurons or processes and the antibody can be used in immunoassays for the receptor. The receptor binds CDNF specifically and with high affinity, acting as part of a complex that mediates/enhances signal transduction by GDNF, i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

Rat RetL1 and mouse and human RetL2 and RetL3 CC sequences (see W37457 and W37460-65) are also claimed. The sequences (see W37457 and W37460-65) are also claimed. The Ligand CC is a key component of the Ret signalling pathway that specifically CC interacts with Ret receptor, triggering Ret dimerisation and/or CC autophosphorylation of the Ret tyrosine kinase domain. Vectors CC containing retL1 DNA and prokaryotic or eukaryotic host cells transformed or transfected with these vectors are claimed, as well CC as a method for production of RetL1, its soluble variants and fision CC proteins with a toxin, inageable compound or radionuclide. RetL1, CC optionally when expressed from vectors in vivo, is used to promote CC repursive the expressed from vectors in vivo, is used to promote CC containly when expressed from vectors in vivo, is used to promote CC another with HIV or Creutzfeldt-Jakob disease, multiple sclerosis, CC mephritis, kidney transplants, toxic or hypoxic injury, CC associated with HIV or Creutzfeldt-Jakob disease), cranial nerve or Spinal cord injury, developmental disorders such as Down's syndrome CC and cerebral palsy, or conditions involving the peripheral nervous system (Lyme disease, muscular dystrophy and mysathenia gravis). CC rusion proteins are used to deliver toxins etc. to Ret-expressing CC cells, especially tumours.

Claim 2: Page 60-61; 113pp; English.

CC This amino acid sequence comprises a human Ret ligand (RetL) RetL1

CC partial polypeptide sequence, deduced from a partial clone (see

CC V00246) isolated from a human embryonic kidney cDNA library; a

CC full-length RetL1 sequence (see W37459) is also claimed, as well

CC as rat RetL1 and mouse and human RetL2 and RetL3 sequences (see

CC W37457 and W37460-63). Ret ligand is a key component of the Ret

CC signalling pathway that specifically interacts with Ret receptor

CC protein, triggering Ret dimerisation and/or autophosphorylation of

CC the Ret tyrosine kinase domain. Vectors containing retL1 DNA and

CC prokaryotic or eukaryotic host cells transformed or transfected

CC with these vectors are claimed, as well as a method for production

CC imageable compound or radionuclide. RetL1, optionally when

CC expressed from vectors in vivo, is used to promote growth of new

CC tissue and survival of damaged tissue, particularly kidney or

CC neural tissue. Typical applications are in renal failure,

CC neural tissue. Typical applications are in renal failure,

CC neural tissue. Typical applications are in renal failure,

CC neural tissue. Typical applications (e.g. multiple sclerosis,

Daterial, viral or prion infections (e.g. multiple sclerosis,

CC system (Lyme disease, muscular disorders such as Down's syndrom.

CC system (Lyme disease, muscular dystrophy and myasthenia gravis).

CC system (Lyme disease, muscular dystrophy and myasthenia gravis).

CC ells, especially tumours.

CC A this amino acid sequence comprises mouse Ret ligand (RetL) RetL3, deduced from cDNA clones (see v00249) isolated from an EST deduced from cDNA clones (see v00249) isolated from an EST deduced from cDNA clones (see v00249) isolated from an EST claimed. RetL1 and RetL3 cdatabase and by 5'RACE. Rat and human RetL1, human RetL2 and RetL3 csequences (see W37457-60 and W37462-63) are also claimed. RetL is calculated to component of the Ret signalling pathway that specifically component of the Ret signalling pathway that specifically component of the Ret signalling pathway that specifically component of the Ret tyrosine kinase domain.

CC and/or autophosphorylation of the Ret tyrosine kinase domain.

CC vectors containing retL3 DNA and prokaryotic or eukaryotic host cells transformed or transfected with these vectors are claimed, as component of retL3, its soluble variants and compound for proteins with a toxin, imageable compound or radionuclide. CC well as a method for production of RetL3, its soluble variants and ccellar proteins with a toxin, imageable compound or radionuclide. CC particularly when expressed from vectors in vivo, is used to compound growth of new tissue and survival of damaged tissue, are in creal failure, nephritis, kidney transplants, toxic or hypoxic injury, neurodegeneration, motor neurone disease, multiple sclerosis, associated with HIV or Creutzfeldt-Jakob disease, cranial nerve or spinal cord injury, developmental disorders such as Down's syndrome can conditions involving the peripheral nervous system (Lyme disease, muscular dystrophy and myasthenia gravis).

CC convences and the conditions involving the peripheral nervous cystem (Lyme disease, muscular dystrophy and myasthenia gravis).

CC convences and the conditions involving the peripheral nervous cystem (Lyme disease, muscular dystrophy and myasthenia gravis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      07-MAY-1997; U07726.

Mouse Ret ligand retL3 partial sequence.
Ret ligand; RetL; RetL3; receptor; signal transduction; mouse; cell growth; renal cell; nerve cell; renal failure; nephritis; kidney transplant; toxic injury; hypoxic injury; neurodegeneration; motor neurone disease; multiple sclerosis; infection; meningitis; myelopathy; Creutzfeldt-Takob disease; cranial nerve injury; spinal cord injury; Down's syndrome; crarebral palsy; Lyme disease; muscular dystrophy; myasthenia gravis; tumour; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               renal failure, nephritis, kidney transplants, toxic or hypoxic injury, neurodegeneration, motor neurone disease, multiple sclerosis, bacterial, viral or prion infections (e.g. meningitis, myelopathy associated with HIV or Creutzfeldt-Jakob disease), cranial nerve or spinal cord injury, developmental disorders such as Down's syndrome and cerebral palsy, or conditions involving the peripheral nervous system (Lyme disease, muscular dystrophy and myasthenia gravis). Fusion proteins are used to deliver toxins etc. to Ret-expressing cells, especially tumours.

A full-length mouse RetL3 sequence (see W37461) was also obtained. Rat, mouse and human retL1, retL2 and retL3 cDNA sequences (see V00245-51) and encoded polypeptides (see W37457-63) are claimed and can be used in methods for promoting cell growth and improving survival of cells, especially renal or neural cells.
                                                                                                                                                                                                                                                                              07-MAY-1997; U07726.

Claim 2; Page 81-82; 113pp; English.

This amino acid sequence comprises a human Ret ligand (RetL) Retl partial polypeptide sequence, deduced from a partial clone (see V00250) isolated from a human adult heart cDNA library; a full-length RetL3 sequence (see W37463) is also claimed, as well as rat and human RetL1, human RetL2 and mouse RetL3 sequences (see W37455-61). Ret ligand is a key component of the Ret signalling pathway that specifically interacts with Ret receptor protein, triggering Ret dimerisation and/or autophosphorylation of
                                                                                                                                                                New nucleic acid encoding ret vectors, transformed cells growth and improving survival
                                                                                                                                                                                                                                (BIOJ ) BIOGEN INC.

                                                                                                                                                                                                                                                                                                                                                       R94563;
21-JUN-1996 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the Ret tyrosine kinase domain. Vectors containing reti3 DNA and prokaryotic or eukaryotic host cells transformed or transfected with these vectors are claimed, as well as a method for production of Reti3, its soluble variants and fusion proteins with a toxin, imageable compound or radionuclide. Reti3, optionally when expressed from vectors in vivo, is used to promote growth of new tissue and survival of damaged tissue, particularly kidney or neural tissue. Typical applications are in renal failure,

Chicken cytotactin (R94563) and human cytotactin (R94562) are
multidomain extracellular matrix proteins capable of simulating
neuronal cell attachment, neurite outgrowth and cell elongation.
The cytotactins, or functional portions of them (see R94564-69),
can be obtd. by expression of encoding DNA (see T14548 and
(T14547) in host cells, e.g. as GST fusion proteins in Escherichia
coli. They have therapeutic and diagnostic applns. and can he

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 42.322; Variance 73.547; scale 0.575

Statistics: Mean 42.421; Variance 67.360; scale 0.630

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
